

Blueprint

Blueprint

Isaac Trejo Mendoza, Jeongha Park, Jacob McPherson, Obadiah Sieg

Recap

- Blueprint is a task manager web application that allows users to
 - (1) collaborate
 - (2) assign project roles and tasks
 - (3) see their progress
- Goal/what makes it different: a simple project management tool that is more palatable and easier to use than the more complicated, corporate ones
- Tools: React-Vite for the front end, Supabase for the backend, Vercel for hosting, Figma for UI inspiration and collaborative teamwork, and GitHub for hosting and repository, which will be covered later in the presentation.

What this Presentation will Cover

- What's changed/what we've implemented since the last presentation
- More specifically, this presentation will cover our final paper
 - Technology
 - Design
 - Deployment: How You can Deploy it Yourself
 - Known Issues and How We Dealt with Them
- Additionally, this presentation will provide you with our experience with the tools we used and include our comments on the completion of the project itself
- Lastly, this presentation will contain physical overview of the project itself and allow the users to explore it themselves

Technology

- **Github:** easy to use and convenient for tools like Vercel
- **React-Vite:** extremely easy for building a website, as it already has the built in assets to do so
- **Supabase:** SQL based database, perfect for hosting a website, as it already has support for Google OAuth
- **Vercel:** easy and simple to use, connects straight to GitHub, and updates in real time as you update it
- **Figma:** great tool for coming up with ideas for your UI and communicating ideas quickly

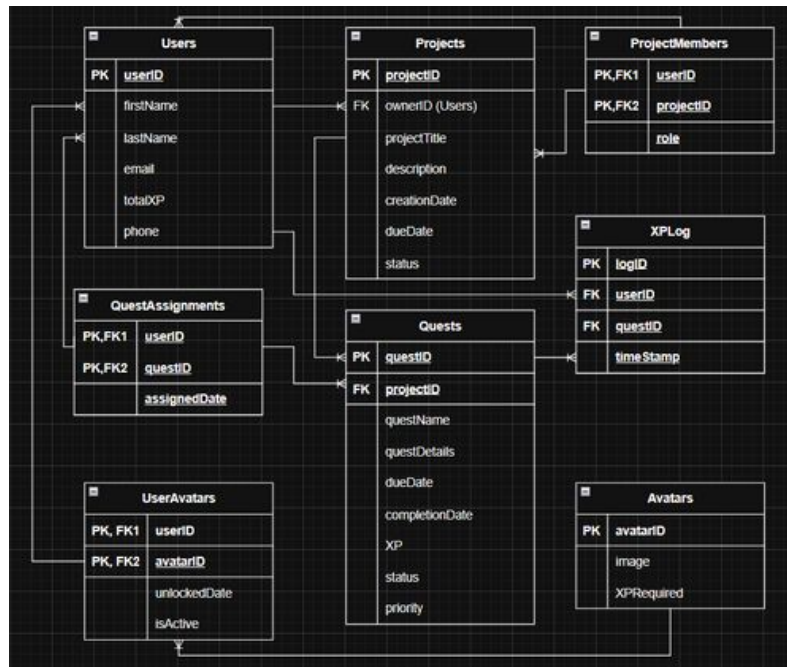

Design

- Classes

- Home
- FullCalendar
- TaskList
- ProfileSidebar
- LeftSidebar
- Two interfaces: Quest and Project
- Supporting components: MinimalCalendar, InviteModal, and Settings

- Database Tables

- See right

Design (continued)

- **Server-side Scripts**
 - Authentication and User Onboarding
 - Gamification and XP Automation
 - Security and Collaboration
 - Real-Time Synchronization
- **Required Data Files**
 - .env.local
 - package.json
 - SQL scripts (located in the /sql directory)
 - Index.css
- **Others**
 - Hot Module Replacement via Vite
 - Lucide-React
 - Optimistic UI Updates
 - Pre-Deployment Demos/Localhost:5173

Deployment

- To deploy yourself
 - Establish a repository in GitHub
 - Initialize Supabase
 - Declare environment variables with Supabase
 - Host locally on port 5173 to ensure it works before publishing
 - Visit Vercel and link your GitHub for a fast and easy deployment
- Known Issues
 - Tight Coupling
 - Real-Time Subscription Latency and Inconsistencies
 - Complex Row Level Security Intense Edge Cases
 - Incomplete Gamification Feedback Loop/Animation Bugs
 - Limited Mobile Touch Interactions within the Calendar

Questions?

Thank you all for listening. Feel free to visit the website/ follow along via the QR code above.
